

The IT tools to be used during the project are already selected. As one of the project goals is to integrate the University's knowledge into the development of picosatellites, the selected tools have been picked up from FLOSS software.

One of the difficulties we face is that the INTA, the spanish space agency, has strong limitations over the software that can be installed on their computers. As a result, all the IT tools choosed are web applications that need nothing more than a web browser from the users part.

The main packages selected are:

- E-Groupware
- Knowledgetree
- Jabber

In order to integrate this applications, the hosting machine runs

- Postfix
- Openldap
- Debian
